AIOS Sales Collateral

The Enterprise Agentic Harness — sales-ready artifacts derived from the positioning thesis.

---

1. 90-Second Elevator Pitch

Two forces are converging right now. First: efficiency is the strategic moat. Free cash funds M&A, M&A buys market position, and the most efficient operator wins the decade. Second: the customer interface is moving off the screen. Inside eighteen months, a meaningful share of enterprise interactions happen through ChatGPT, Claude, and vertical agents — not through your SaaS UIs.

Most enterprises will respond by buying two things. An automation vendor for internal efficiency, and an agent platform for external addressability. They will spend the next decade integrating them.

AIOS is the harness. One cognitive core that sits between the legacy stack and the agentic world. We embed, capture how work actually gets done, and ship autonomous workflows that execute across your existing systems — no rip-and-replace, priced per successful task. And every workflow we ship is, by construction, an agent-callable interface. The workflow that closes your books faster is the same workflow a partner's agent calls to query AP status.

One investment. Two compounds. Operational efficiency now, agentic addressability later — from a single artifact.

Worth twenty minutes next week?

---

2. One-Pager

The harness between your enterprise and the agentic economy.

Two forces are reshaping the enterprise simultaneously. Efficiency has become the strategic moat — free cash compounds into M&A capacity and market position. And the customer interface is moving off the screen — inside eighteen months, ChatGPT, Claude, and vertical agents will mediate a meaningful share of B2B interactions. Most operators will treat these as separate problems and buy two stacks. The next decade becomes integration work.

AIOS is one cognitive core that solves both. **Play 1: agentify the legacy.** We embed with your team, capture how work actually happens, and ship autonomous workflows that execute across

ERP, CRM, billing, HRIS, and the long tail of SaaS. No rip-and-replace. Priced per successful task — failed work, no fee. Operational efficiency in weeks, not quarters. **Play 2: expose to the agentic economy.** Every workflow we ship is an agent-callable interface by construction. The same cognitive core exposes a stable A2A surface to OpenAI, Anthropic, Google, and partner agents. Your enterprise becomes agentically addressable.

The moat is the trust contract. Hyperscalers can't run autonomous workflows against your GL — they train models, consume data, and compete in your markets. SaaS vendors own the data being acted on. Only an independent substrate passes the audit committee. Once twenty workflows run against your books, switching means redoing twenty SOC 2 attestations.

SOC 2 Type II. HIPAA. SOX-ready. EU AI Act-architected. Immutable, customer-inspectable audit ledger.

Twenty minutes — we'll show you the workflow library and the outcome model.

---

3. 5-Slide Investor Deck Outline

Slide 1 — Two Forces, One Convergence

- Efficiency is now the strategic moat: free cash funds M&A, M&A buys position
- The customer interface is moving off the screen: ChatGPT, Claude, vertical agents mediate B2B
- Both forces hit the same enterprises in the same 24-month window
- Most operators will buy two stacks and spend a decade integrating them
- One artifact can solve both — if it has one cognitive core

Speaker notes: Nikesh Arora said the loud part out loud last quarter — the most important lever today is running the most efficient enterprise. Layer on the agent interface shift and you have a once-a-decade convergence.

Slide 2 — The Thesis: The Enterprise Agentic Harness

- AIOS sits between the legacy stack and the agentic world
- Play 1: ship autonomous workflows across existing systems (no rip-and-replace)
- Play 2: every shipped workflow is, by construction, an agent-callable interface
- One investment. Two compounds. Operational efficiency and external addressability
- Same artifact, same cognitive core — solving with two vendors leaves you with integration debt

Speaker notes: The harness metaphor matters. We don't replace the horse. We make it controllable, accountable, and composable with everything else in the field.

Slide 3 — Why Now, Why Not the Hyperscalers

- Window math: MCP/A2A v1.0 in 12 months + 9-12 month F500 procurement + 90-day workflow lock-in
- Therefore 18-24 months before this layer is owned
- Hyperscalers structurally compromised: model trainers, data consumers, market competitors
- Audit committees will not approve autonomous workflows against the GL from a vendor with conflict of interest
- The independent substrate is the only viable position — and only one wins it

Speaker notes: This isn't a feature gap. It's a governance gap. The hyperscalers can ship the tech tomorrow and still lose the procurement vote.

Slide 4 — Opportunity: Winner-Take-Most

- Every F2000 needs this layer; cognitive substrate is a per-enterprise install
- Workflow library compounds across customers — each install makes the next one cheaper
- A2A protocol convergence is tailwind, not headwind: we become the Cloudflare of agent traffic
- Switching cost after 20 workflows: 20 SOC 2 attestations, 20 audit reviews, 20 change-management cycles
- First credible substrate becomes the only credible substrate — Snowflake arc

Speaker notes: This is a category where the winner installs once and compounds for a decade. Second place doesn't get a consolation prize.

Slide 5 — Why AIOS, and the Ask

- Outcome pricing: per successful task, four tiers ($10/$35/$175/$450), failed = no fee
- 70-90% gross margin on outcome fee (not token reseller economics)
- Compliance posture: SOC 2 Type II, HIPAA, SOX-ready, EU AI Act-architected
- Immutable audit ledger — every action recorded, customer-inspectable, regulator-inspectable
- Raising to fund FDE capacity, workflow library, and A2A surface buildout

Speaker notes: The ask funds the land mechanism. The compounds happen on their own after install.

4. Sales Objection Handling Deck

#	Objection	Counter	Sharp Line
1	"This is the abstraction layer graveyard. iPaaS, ESB, RPA all failed here."	iPaaS, ESB, and RPA abstracted wires — they sat between systems and moved data. They never abstracted work. Cognition — how decisions get made, sequenced, and executed across systems — is currently unowned. We are not the seventh attempt at the same layer. We are the first attempt at a layer that didn't exist before LLMs made it possible.	**"They abstracted wires. We abstract work."**
2	"Hyperscalers will eat this. Microsoft, Google, AWS all ship agent platforms."	Two gates they can't pass. First, trust: model trainers, data consumers, market competitors don't get autonomous write access to the GL — the audit committee rejects it. Second, composition: none of them span vendor boundaries cleanly because each is fighting for lock-in. Protocol convergence around MCP and A2A is tailwind for us. We are the Cloudflare of agent traffic.	**"Hyperscalers ship agents. We ship the layer that governs them."**
3	"Two-buyer problem. CFO buys efficiency, CEO buys interface. Who signs?"	One buyer. Land on Play 1 — the CFO buys operational efficiency on outcome pricing. Play 2 ships as a free side-effect of the same artifact. The CEO discovers the strategic option ninety days post-install when a partner's agent successfully queries AP status. That's the Snowflake arc — bought as a data warehouse, became the data plane.	**"We sell Play 1. Play 2 ships in the box."**
4	"Outcome pricing plus forward-deployed engineers — the unit economics don't work."	Outcome fee is 70-90% gross margin. We are not reselling tokens — compute is pass-through at plus five percent, or zero on BYOK. Forward-deployed is a land mechanism, not steady-state. FDE intensity drops sharply as the workflow library compounds. And outcome pricing closes deals subscription cannot — failed AI pilots cost real money; we don't take payment unless we deliver.	**"Risk reversal is the deal-closer subscription can't match."**
5	"You're assuming single-vendor consolidation. Customers will run multiple agents."	Agreed — and that's the point. We are not the only agent vendor. We are the layer that makes the agent vendors coherent. Keep Copilot. Keep Agentforce. Keep the vertical agents. AIOS composes above them with one policy surface, one audit ledger, one cognitive core. Kubernetes didn't kill containers. It made them deployable at scale.	**"Kubernetes for cognition. Not a replacement — a coordinator."**

6	"The 18-24 month window feels hand-wavy."	It's derived. MCP and A2A protocols hit v1.0 inside twelve months — the standards work is public. F500 procurement cycles run nine to twelve months from first call to PO. Workflow lock-in compounds within ninety days of go-live. Compound those numbers. Eighteen to twenty-four months is when the substrate gets installed, not when it gets considered.	"**Procurement math. Not vibes.**"
7	"Your moat is a feature list. Everything you do is replicable."	The moat is not the features. It is the trust contract with the audit committee. Twenty workflows running against the GL means twenty SOC 2 attestations, twenty audit-committee reviews, twenty change-management cycles. The switching cost is not technical; it is governance. And every workflow we ship adds to a library that compounds across customers.	"**The moat is the audit committee's signature.**"
8	"The Arora quote is thin. You're hanging a thesis on a paraphrase."	Fair — we are tightening the citation and adding the structural data. The thesis does not require the quote. Public F500 earnings calls in 2025 and 2026 show efficiency language replacing growth language as the dominant operating-model frame. The quote is illustrative; the trend is structural and measurable in operating margin guidance.	"**The quote is color. The margin guidance is the data.**"
9	"Who's actually asking for Play 2? Where's the demand signal?"	No one is asking yet. That is the point. We do not sell Play 2. We ship it. Buyers recognize the strategic option after install — usually when a partner agent or a buyer-side ChatGPT instance successfully transacts against the A2A surface. Then the internal reference story closes the next ten deals. Demand follows capability, not the other way around.	"**We don't forecast Play 2 demand. We install the option.**"
10	"You're silent on regulation and liability. EU AI Act, SOX, HIPAA — what happens when an agent acts wrong?"	The audit ledger is the compliance posture, not a feature on top of it. Every action records actor, intent, permitting policy, system acted on, outcome, and timestamp. Immutable. Customer- and regulator-inspectable. EU AI Act Article 9 through 15 requirements are architected into the substrate. Liability splits cleanly: we are the substrate; the customer authors the policy. Same split as cloud infrastructure.	"**Compliance is the architecture. Not a checkbox on top of it.**"

5. CFO Talk Track (5 minutes)

Three minutes on the financial model. Two on the audit.

Failed AI pilots cost real money. The McKinsey number is somewhere north of seventy percent of enterprise AI initiatives don't reach production. You've probably written off at least one yourself. The reason isn't the technology — it's the commercial model. Subscription pricing means you pay for capacity whether the work gets done or not. The vendor's incentive is to sell seats; yours is to get outcomes. The economics are misaligned from day one.

We invert that. AIOS is priced per successful task. Four tiers — ten dollars for simple, thirty-five for standard, one seventy-five for complex, four-fifty for strategic. Failed task, no outcome fee. Compute is pass-through at plus five percent, or zero if you bring your own keys. Quarterly not-to-exceed cap, so you have a hard ceiling for forecasting.

Outcome is computed deterministically from execution telemetry — nodes executed, tool calls, compute time, approvals, token cost. Not opinion. Not negotiation. The ledger says the task completed or it didn't. Disputes go against the immutable audit record, not against a sales rep.

Here is the financial math. A typical Standard-tier task — say, a vendor invoice reconciliation that today takes a clerk forty minutes — costs us a couple of dollars to run and bills you thirty-five. Your fully-loaded cost for that forty minutes is somewhere between twenty-five and forty-five dollars depending on geography. Your operational savings margin per successful task is sixty to eighty percent. At ten thousand of those a month, you've moved real dollars to free cash.

Why does that matter beyond the line item? Free cash compounds into M&A capacity. M&A capacity buys market position. The most efficient operator in your sector over the next thirty-six months has materially more optionality than the second-most-efficient operator. That's the strategic point — but the line-item case stands on its own.

On audit. SOC 2 Type II. HIPAA. SOX-ready. The audit ledger is immutable and customer-inspectable. Every autonomous action records the actor, the intent, the policy that permitted it, the system acted on, the outcome, the timestamp. Your internal audit team can subpoena the ledger directly — no ticket to us required. External auditors get the same access.

This is the cleanest financial instrument in enterprise AI. You pay for outcomes, you forecast against a cap, you audit against a ledger. The risk reversal is real, not rhetorical.

What's a workflow worth reconciling first?

---

6. CIO/CTO Talk Track (5 minutes)

Start with the trust contract, because it is the only part of this conversation that actually matters.

You are being asked to let autonomous software make changes inside your finance, HR, and contracts systems. That is a governance event, not a procurement event. Your audit committee will ask one question: who is the vendor, and what is their incentive structure relative to our data?

The hyperscalers fail that question. They train models on enterprise data, they consume your usage telemetry, and they compete with you in adjacent markets. The SaaS vendors fail that question — they own the data the agent is acting on, so giving them autonomous write access is a conflict on its face. The only entity that can pass the audit committee is an independent substrate whose entire economic model depends on the integrity of the action it took. That is the trust contract. That is what AIOS is.

Architecturally we sit above the existing stack. No rip-and-replace. No data migration. We connect through your existing APIs, SSO, and identity provider. Your ERP stays. Your CRM stays. The vertical SaaS stays. AIOS is the cognitive layer that observes, decides, and executes across all of them.

Every autonomous action runs through a policy engine. The policy engine is deterministic — not a model. Actions never escape explicit allow-rules. If the rule says the agent can refund up to five hundred dollars without human approval, it cannot refund five hundred and one. The model proposes; the policy disposes. That's the architectural commitment.

The audit ledger is immutable and customer-inspectable. Every action records actor, intent, permitting policy, system acted on, outcome, timestamp. EU AI Act Article 6 high-risk classification was assumed from day one — Articles 9 through 15 are architected into the substrate, not bolted on. SOC 2 Type II. HIPAA. SOX-ready. The compliance posture isn't a feature list; it's the architecture.

Now the part most CIOs don't think about until twelve months too late. Every workflow we ship is, by construction, an agent-callable interface. The same workflow that closes your books faster is the workflow a partner's agent calls to query AP status. The same substrate that runs your internal automation exposes a stable A2A surface to ChatGPT, Claude, Google's agent fabric, and your buyers' agents.

You don't have to build that twice. You don't have to pick between an internal automation platform and an external agent gateway. The harness is one artifact with two surfaces.

That's the architectural elegance. What part of the stack do you want to harden first?

---

7. CEO Talk Track (5 minutes)

Two things are happening to your business at the same time, and they need to be solved with one decision.

The first is that efficiency has become the strategic moat. Not a virtue, not a cost-discipline narrative for the earnings call — the actual moat. The operators who compound free cash over the next thirty-six months buy the operators who don't. M&A capacity is the real scoreboard, and operating margin is what funds it. Your CFO already knows this. The question is whether you build the efficiency advantage with a vendor whose commercial model is aligned to outcomes, or with one whose model is aligned to seat count.

The second is that your customer interface is moving off the screen. Inside eighteen months a meaningful share of B2B interactions will be mediated by ChatGPT, Claude, and vertical agents acting on behalf of buyers, partners, and regulators. The companies whose capabilities are agent-callable participate in that economy. The companies whose capabilities are buried behind two hundred SaaS UIs are not findable. Search era ended; agent era starts. Your competitors are not going to advertise this transition until they've already done it.

Most CEOs will treat these as two separate problems. They'll buy an automation vendor for the first and an agent platform for the second. Then they'll spend the next decade integrating them, and the integration will never quite finish.

AIOS is one artifact that solves both. One cognitive core. Play 1: we ship autonomous workflows across your existing systems and bill per successful task. Play 2: every workflow we ship is, by construction, an interface that ChatGPT, Claude, and partner agents can call. The same workflow that closes your books faster is the workflow your customer's agent queries to check order status. One investment. Two compounds.

This is a Snowflake-shaped arc. The first credible independent substrate becomes the only credible independent substrate, because the moat isn't the technology — it's the trust contract with the audit committee. Once twenty workflows run against your general ledger, switching means redoing twenty SOC 2 attestations. The first installer compounds. Second place doesn't get a substrate.

Your company is going to be the reference story for one of two narratives. Either you are the case study for the operator who moved early and compounded both efficiency and addressability from one investment. Or you are renting capability from whoever your competitor installed first.

The window is eighteen to twenty-four months. That's not a sales line — it's procurement math. Protocol convergence in twelve, F500 procurement in nine, workflow lock-in in ninety days.

Twenty minutes with your CFO and CIO next week. We bring the workflow library. You bring the first system you'd let us harness.
